DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-4, 14-17 are rejected under 35 U.S.C. 102(b) as being anticipated by Bulow (US 6,128,110).

Regarding claim 1, Bulow discloses an optical element (Fig. 20) comprising:

two control inputs S1 and S2, and an optical processing arrangement comprising mirrors OM10, OM12, M80, and beam splitter OS10 that corresponds to a logical NOR function of the two inputs S1 and S2 (lines 35-53, col. 23).

Regarding claim 2, the two inputs S1 and S2 are optical inputs (lines 42-44, col. 22).

Regarding claim 4, a single optical laser source may be used to provide the two optical inputs (lines 60-63, col. 20).

Regarding claim 3, the optical arrangement of Fig. 21 is such that one of the optical outputs represents the logical NOR function of control inputs CS1, CS2, wherein said inputs may be electrical inputs (see output 7 in the truth table of col. 25-26, for logic states 1, 9, 49, and 58, and lines 45-46, col. 24).

Regarding claims 14-16, the optical NOR gate is part of an optical processor (lines 25-40, col. 22). 359

Regarding claim 17, the optical NOR gate of Fig. 20 may be used in conjunction with a communication network controller (lines 10-14, col. 4).

Allowable Subject Matter

Claims 5-13 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claims 5-13 are allowable over the prior art of record for at least the reason that even though the prior art discloses optical NOR gates, the prior art fails to teach or reasonably suggest an optical element comprising at least one combination of optical elements producing respective XOR and COIN function outputs of the two control inputs which function outputs are used in producing a logical NOR function of the two control inputs, as set forth by the claimed combination.

In the NOR gate of Fig. 20, the NOR function is achieved by using the combination of output S5 and constant input N1.
